

Pioneer Crossing Landfill Gas Electric Generation Plant

The Pennsylvania DEP is supporting a proposed Landfill Gas Electric Generating Plant to be built on the Pioneer Crossing Landfill. Naturally occurring methane gas (from decomposition of refuse) will be used to generate electricity. The initial output would be about 6400 kilowatts, and would increase as the landfill expands through its projected end of life in 2013. The gas would still be produced and the plant would be in operation for up to 25 years after the landfill ceased operation. For more information, click the document to the right.
